Exercise 1.3

## Question 1:

Prove that  $\sqrt{5}$  is irrational.

### Answer 1:

Let  $\sqrt{5}$  is a rational number.

Therefore, we can find two integers  $a, b$  ( $b \neq 0$ ) such that  $\sqrt{5} = \frac{a}{b}$ . Let  $a$  and  $b$  have a common factor other than 1. Then we can divide them by the common factor, and assume that  $a$  and  $b$  are co-prime.

$$\begin{aligned} a &= \sqrt{5}b \\ \Rightarrow a^2 &= 5b^2 \end{aligned}$$

Therefore,  $a^2$  is divisible by 5 and it can be said that  $a$  is divisible by 5.

Let  $a = 5k$ , where  $k$  is an integer

$$\begin{aligned} (5k)^2 &= 5b^2 \\ \Rightarrow 5k^2 &= b^2 \end{aligned}$$

This means that  $b^2$  is divisible by 5 and hence,  $b$  is divisible by 5.

This implies that  $a$  and  $b$  have 5 as a common factor.

And this is a contradiction to the fact that  $a$  and  $b$  are co-prime.

Hence,  $\sqrt{5}$  cannot be expressed as  $\frac{p}{q}$  or it can be said that  $\sqrt{5}$  is irrational.

## Question 2:

Prove that  $3 + 2\sqrt{5}$  is irrational.

### Answer 2:

Let  $3 + 2\sqrt{5}$  is rational.

Therefore, we can find two co-prime integers  $a, b$  ( $b \neq 0$ ) such that

$$\begin{aligned} 3 + 2\sqrt{5} &= \frac{a}{b} \\ \Rightarrow 2\sqrt{5} &= \frac{a}{b} - 3 \\ \Rightarrow \sqrt{5} &= \frac{1}{2} \left( \frac{a}{b} - 3 \right) \end{aligned}$$

Since  $a$  and  $b$  are integers,  $\frac{1}{2} \left( \frac{a}{b} - 3 \right)$  will also be rational and therefore,  $\sqrt{5}$  is rational.

This contradicts the fact that  $\sqrt{5}$  is irrational. Hence, our assumption that  $3 + 2\sqrt{5}$  is rational is false.

Therefore,  $3 + 2\sqrt{5}$  is irrational.

## Question 3:

Prove that the following are irrationals:

(i)  $\frac{1}{\sqrt{2}}$

(ii)  $7\sqrt{5}$

(iii)  $6 + \sqrt{2}$

### Answer 3:

(i)  $\frac{1}{\sqrt{2}}$

Let  $\frac{1}{\sqrt{2}}$  is rational.

Therefore, we can find two co-prime integers  $a, b$  ( $b \neq 0$ ) such that

$$\frac{1}{\sqrt{2}} = \frac{a}{b}$$

Or

# Mathematics

(Chapter - 1) (Real Numbers)

(Class X)

$$\sqrt{2} = \frac{b}{a}$$

$\frac{b}{a}$  is rational as  $a$  and  $b$  are integers.

Therefore,  $\sqrt{2}$  is rational which contradicts to the fact that  $\sqrt{2}$  is irrational.

Hence, our assumption is false and  $\frac{1}{\sqrt{2}}$  is irrational.

**(ii)**  $7\sqrt{5}$

Let  $7\sqrt{5}$  is rational.

Therefore, we can find two co-prime integers  $a, b$  ( $b \neq 0$ ) such that

$$\begin{aligned}7\sqrt{5} &= \frac{a}{b} \\ \Rightarrow \sqrt{5} &= \frac{a}{7b}\end{aligned}$$

$\frac{a}{7b}$  is rational as  $a$  and  $b$  are integers.

Therefore,  $\sqrt{5}$  should be rational.

This contradicts the fact that  $\sqrt{5}$  is irrational. Therefore, our assumption that  $7\sqrt{5}$  is rational is false.

Hence,  $7\sqrt{5}$  is irrational.

**(iii)**  $6 + \sqrt{2}$

Let  $6 + \sqrt{2}$  be rational.

Therefore, we can find two co-prime integers  $a, b$  ( $b \neq 0$ ) such that

$$\begin{aligned}6 + \sqrt{2} &= \frac{a}{b} \\ \Rightarrow \sqrt{2} &= \frac{a}{b} - 6\end{aligned}$$

Since  $a$  and  $b$  are integers,  $\frac{a}{b} - 6$  is also rational and hence,  $\sqrt{2}$  should be rational. This contradicts the fact that  $\sqrt{2}$  is irrational. Therefore, our assumption is false and hence,  $6 + \sqrt{2}$  is irrational.
